

<p><b>Task 1: Installing Node-RED on a Raspberry Pi through Remote Login.</b></p> <p><b>Step 1: Access Raspberry Pi via SSH</b></p> <ul style="list-style-type: none"> <li>• Use <b>PuTTY</b> (Windows) or <b>Terminal</b> (macOS/Linux).</li> <li>• Connect using:</li> <li>• <code>ssh pi@raspberrypi.local</code></li> <li>• Enter the password when prompted.</li> </ul> <p><b>Step 2: Update and Upgrade Raspberry Pi</b>  <code>sudo apt-get update &amp;&amp; sudo apt-get upgrade -y</code></p> <p><b>Step 3: Install Node-RED</b>  Run the official installation script:  <code>bash &lt;(curl -sL https://raw.githubusercontent.com/node-red/linux-installers/master/deb/update-nodejs-and-nodered)</code>  This script:</p> <ul style="list-style-type: none"> <li>• Installs/updates Node.js and Node-RED.</li> <li>• Installs necessary build tools.</li> </ul> <p><b>Step 4: Enable Node-RED on Boot (Optional)</b>  <code>sudo systemctl enable nodered.service</code></p> <p><b>Step 5: Start and Manage Node-RED</b></p> <ul style="list-style-type: none"> <li>• Start Node-RED:</li> <li>• <code>node-red-start</code></li> <li>• Stop Node-RED:</li> <li>• <code>node-red-stop</code></li> <li>• Check logs:</li> <li>• <code>node-red-log</code></li> </ul> <p><b>Step 6: Access Node-RED Interface</b>  Open a web browser and visit:  <code>http://&lt;raspberrypi.local&gt;:1880</code>  Replace <code>&lt;raspberrypi.local&gt;</code> with your Raspberry Pi's IP or hostname.</p> <p><b>Step 7: (Optional) Secure Node-RED</b></p> <ul style="list-style-type: none"> <li>• Configure authentication and HTTPS in <code>~/node-red/settings.js</code>.</li> </ul> <p>This completes the installation of Node-RED on a Raspberry Pi via remote login.</p>	<p><b>Task 2:- Create a simple Node-RED flow that takes input from an inject node and displays output in a debug node. Add a function node to modify the payload in the flow.</b></p> <p><b>Step 1: Access the Node-RED Editor</b></p> <ul style="list-style-type: none"> <li>• Open your web browser and navigate to <code>http://localhost:1880</code> if running locally.</li> </ul> <p><b>Step 2: Add Nodes to the Flow</b></p> <ul style="list-style-type: none"> <li>• <b>Inject Node:</b> Drag an Inject node from the palette onto the workspace. This node allows manual triggering of the flow.</li> <li>• <b>Function Node:</b> Drag a Function node onto the workspace to modify the payload.</li> <li>• <b>Debug Node:</b> Drag a Debug node onto the workspace to display output in the debug sidebar.</li> </ul> <p><b>Step 3: Connect the Nodes</b></p> <ul style="list-style-type: none"> <li>• Wire the Inject node to the Function node.</li> <li>• Wire the Function node to the Debug node.</li> </ul> <p><b>Step 4: Configure the Inject Node</b></p> <ul style="list-style-type: none"> <li>• Double-click on the Inject node to open its properties.</li> <li>• Set the payload type (e.g., string or number).  Example: Set a static string like "Hello, World!" or leave it as a timestamp.</li> </ul> <p><b>Step 5: Configure the Function Node</b></p> <ul style="list-style-type: none"> <li>• Double-click on the Function node to open its edit dialog.</li> <li>• Enter JavaScript code to modify the payload:</li> <li>• <code>var fahrenheit = msg.payload;</code></li> <li>• <code>var celsius = (fahrenheit - 32) * (5 / 9);</code></li> <li>• <code>msg.payload = celsius;</code></li> <li>• <code>return msg;</code></li> <li>• Click "Done" to save your changes.</li> </ul> <p><b>Step 6: Deploy the Flow</b></p> <ul style="list-style-type: none"> <li>• Click on the "Deploy" button in the top right corner of the editor to save and activate your flow.</li> </ul> <p><b>Step 7: Test Your Flow</b></p> <ul style="list-style-type: none"> <li>• With the Debug sidebar open, click on the button of the Inject node to trigger it.</li> <li>• Observe the output in the Debug sidebar; it should show your modified payload.</li> </ul>	<p><b>Implement an HTTP request node to interact with an external API. In Node-RED Flow</b></p> <ol style="list-style-type: none"> <li>1. Add a timestamp (inject) node observe payload</li> <li>2. Add a HTTP request node method GET URL: <code>https://worldclockapi.com/</code></li> <li>3. Add a HTML node selector: <code>span</code></li> <li>4. Add a template node Add group ex: (Home) Default template code: <pre>&lt;html&gt; &lt;body&gt; &lt;h1&gt; &lt;div ng-bind- html=msg.payload[1]&gt;&lt;/div&gt; &lt;/h1&gt; &lt;/body&gt; &lt;/html&gt;</pre> </li> <li>5. Deploy</li> </ol>

<h2>Configure security settings for Node-RED, including user authentication.</h2> <p><b>Basic Authentication Setup</b></p> <ol style="list-style-type: none"><li>1. Edit your settings.js file (typically located in ~/.node-red/settings.js).</li><li>2. Enable authentication by uncommenting and modifying the adminAuth section.<ul style="list-style-type: none"><li>○ Generate a password hash using the node-red-admin command:</li><li>○ node-red-admin hash-pw</li></ul></li></ol> <p><b>HTTPS Configuration</b></p> <ul style="list-style-type: none"><li>● To enable HTTPS, add the necessary configuration to your settings.js file.</li></ul> <p><b>Advanced Security Options</b></p> <ol style="list-style-type: none"><li>1. <b>User Permissions</b> (for multi-user environments).</li><li>2. <b>Disable the editor for public access:</b></li><li>3. httpAdminRoot: false,</li><li>4. <b>Enable CORS restrictions</b> as needed.</li></ol>	<h2>Task 5: Build a basic IoT dashboard using the Node-RED dashboard nodes.</h2> <p><b>Step 1: Install the Node-RED Dashboard Module</b></p> <ol style="list-style-type: none"><li>1. Open the Node-RED editor in your browser (e.g., <a href="http://localhost:1880">http://localhost:1880</a>).</li><li>2. Go to the Menu (top-right corner) &gt; Manage Palette &gt; Install.</li><li>3. Search for node-red-dashboard and click <b>Install</b>.</li><li>4. Once installed, dashboard nodes (e.g., buttons, sliders, charts) will appear in the palette.</li></ol> <p><b>Step 2: Create a Dashboard Layout</b></p> <ol style="list-style-type: none"><li>1. Click on the <b>Dashboard</b> tab (top-right corner of the Node-RED editor).</li><li>2. Create a new <b>Tab</b> (a page in the dashboard):<ul style="list-style-type: none"><li>○ Click the <b>+tab</b> button and name it (e.g., "IoT Dashboard").</li></ul></li><li>3. Create a <b>Group</b> within the tab:<ul style="list-style-type: none"><li>○ Click the <b>+group</b> button and name it (e.g., "Sensor Data").</li></ul></li></ol> <p><b>Step 3: Build the Flow</b></p> <ol style="list-style-type: none"><li>1. Drag and drop the following nodes onto the workspace:<ul style="list-style-type: none"><li>○ <b>Inject Node</b> to simulate data input.</li><li>○ <b>Function Node</b> to process or generate dynamic data.</li><li>○ <b>UI Gauge Node</b> to display sensor data on the dashboard.</li><li>○ <b>UI Chart Node</b> to visualize data trends over time.</li></ul></li><li>2. Configure each node:<p><b>Inject Node:</b></p><ul style="list-style-type: none"><li>Set it to inject a random number as payload (e.g., between 0 and 100).</li><li>1. Use the following JavaScript code:<pre>msg.payload = Math.floor(Math.random() * 101); // Random number between 0-100</pre></li><li>4. return msg;</li></ul><ul style="list-style-type: none"><li>○ <b>Function Node:</b><ol style="list-style-type: none"><li>1. Add logic to process or format data if needed.</li></ol></li><li>○ <b>UI Gauge Node:</b><ol style="list-style-type: none"><li>1. Double-click to configure.</li><li>2. Assign it to the created <b>Tab/Group</b> (e.g., "IoT Dashboard &gt; Sensor Data").</li><li>3. Set properties like <b>Label</b> (e.g., "Temperature"), <b>Range</b> (e.g., 0–100), and <b>Units</b> (e.g., "°C").</li></ol></li><li>○ <b>UI Chart Node:</b><ol style="list-style-type: none"><li>1. Assign it to the same <b>Tab/Group</b>.</li><li>2. Configure it to display a time-series chart.</li></ol></li></ul></li></ol>	<h2>Integrate an MQTT node into a Node-RED flow and subscribe to a topic</h2> <p><b>1. Install and Configure Node-RED</b></p> <ul style="list-style-type: none"><li>• Ensure Node-RED is installed on your system. If not, install it using npm install -g --unsafe-perm node-red or Docker (docker run -it -p 1880:1880 --name mynodered nodered/node-red).</li><li>• Open the Node-RED editor in your browser (e.g., <a href="http://localhost:1880">http://localhost:1880</a>).</li></ul> <p><b>2. Add MQTT Nodes</b></p> <ul style="list-style-type: none"><li>• Drag an <b>MQTT In</b> node from the palette onto the workspace. This node will subscribe to a topic.</li><li>• Drag a <b>Debug</b> node onto the workspace to display messages in the debug sidebar.</li></ul> <p><b>3. Configure the MQTT Broker</b></p> <ul style="list-style-type: none"><li>• Double-click the <b>MQTT In</b> node to open its configuration.</li><li>• Click the pencil icon next to the <b>Server</b> field to add a new MQTT broker.<ul style="list-style-type: none"><li>◦ Enter the broker address (e.g., <a href="http://mqtt://broker.hivemq.com">mqtt://broker.hivemq.com</a>) and port (default is 1883).</li><li>◦ Add credentials if required (username and password).</li><li>◦ Set QoS (Quality of Service) level as needed (e.g., 0, 1, or 2).</li></ul></li><li>• Save the broker configuration.</li></ul> <p><b>4. Subscribe to a Topic</b></p> <ul style="list-style-type: none"><li>• In the <b>MQTT In</b> node, specify the topic you want to subscribe to (e.g., sensor/temperature).</li><li>• Save the configuration.</li></ul> <p><b>5. Connect Nodes</b></p> <ul style="list-style-type: none"><li>• Wire the <b>MQTT In</b> node to the <b>Debug</b> node. Optionally, add a <b>Function</b> node between them for data processing.</li></ul> <p><b>6. Deploy and Test</b></p> <ul style="list-style-type: none"><li>• Click <b>Deploy</b> in the top-right corner of Node-RED.</li><li>• Publish a message to the subscribed topic using an MQTT client or tool like <b>MQTTX</b> or <b>mosquitto_pub</b>.</li><li>• Check the <b>Debug</b> sidebar for incoming messages.</li></ul>

## Implement SSL/TLS for secure communication in a Node-RED instance.

### SSL/TLS in Node-RED

#### Overview

SSL (Secure Sockets Layer) and TLS (Transport Layer Security) are cryptographic protocols designed for secure communication over networks. TLS is the successor to SSL.

#### Key Purposes

1. **Encryption:** Prevents eavesdropping by scrambling data.
2. **Authentication:** Verifies the identity of communicating parties.
3. **Data Integrity:** Ensures data remains unaltered.

#### How SSL/TLS Works

1. **Handshake Process:**
  - Client connects to SSL-enabled server.
  - Server presents its digital certificate.
  - Client verifies the certificate.
  - Secure session keys are established.
2. **Symmetric Encryption:** Used for faster session encryption after the handshake.

#### Key Components

1. **Certificates:** Verify identity (issued by CAs, contain public key and identity information).
2. **Public/Private Key Pair:**
  - Public key encrypts data.
  - Private key decrypts data.
3. **Cipher Suites:** Define cryptographic algorithms.

#### Securing Node-RED with SSL/TLS

1. **Obtain SSL/TLS Certificates**
  - **Self-Signed (Testing):**
  - `openssl req -x509 -newkey rsa:4096 -keyout privkey.pem -out cert.pem -days 365 -nodes -subj "/CN=yourdomain.com"`
  - **Let's Encrypt (Production):**
  - `sudo apt install certbot`
  - `sudo certbot certonly --standalone -d yourdomain.com`
2. **Configure Node-RED for HTTPS**
  - Edit `settings.js` (typically in `~/node-red/settings.js`).
3. **Configure Security Headers**
  - Add security headers in `settings.js`.
4. **Verify Configuration**
  - Restart Node-RED and verify with:
    - `curl -v -k https://localhost:1880`
    - Test SSL configuration for public domains:
    - `openssl s_client -connect yourdomain.com:443 -servername yourdomain.com | openssl x509 -noout -t`

## Include widgets for displaying sensor data and control buttons.

### Step 1: Install Node-RED and Dashboard Nodes

1. Install Node-RED:
  - If Node-RED is not installed, install it on your Raspberry Pi:
  - `sudo apt update`
  - `sudo apt install -y nodejs npm`
  - `sudo npm install -g --unsafe-perm node-red`
  - Start Node-RED:
  - `node-red-start`
  - Access the Node-RED editor at: `http://<Your_RPi_IP>:1880`
2. Install Dashboard Nodes:
  - Go to Menu > Manage Palette > Install.
  - Search for `node-red-dashboard` and install it.

### Step 2: Connect Sensors to Raspberry Pi

- Use a sensor like DHT11 or DHT22 for temperature and humidity readings.
- Connect the sensor to GPIO pins on the Raspberry Pi.
- Install the required Node-RED GPIO nodes:
- `npm install node-red-node-pi-gpio`
- `npm install node-red-contrib-dht-sensor`

### Step 3: Create Dashboard Layout

1. Go to the Dashboard tab in the Node-RED editor.
2. Create a new Tab (e.g., "IoT Dashboard").
3. Add two groups:
  - Sensor Data: For displaying sensor readings.
  - Controls: For control buttons.

### Step 4: Build the Flow

Drag and configure the following nodes:

#### Sensor Data Widgets

1. DHT Sensor Node:
  - Drag a DHT sensor node onto the workspace.
  - Configure it to read temperature and humidity from your connected sensor.
  - Set the GPIO pin where the sensor is connected.
2. UI Gauge Node:
  - Drag a Gauge node to display temperature readings.
  - Configure it with properties like:
    - Label: "Temperature"
    - Range: 0–50°C
    - Units: °C
3. UI Chart Node:
  - Drag a Chart node to visualize temperature trends over time.

#### Control Buttons Widgets

1. UI Button Node:
  - Drag a Button node onto the workspace.
  - Configure it to send commands (e.g., turn on/off an LED or relay).
2. Raspberry Pi GPIO Out Node:
  - Connect the Button node to a GPIO Out node to control devices like LEDs or relays.

### Step 5: Deploy and Test

1. Click Deploy in the top-right corner of Node-RED.
2. Access your dashboard at: `http://<Your_RPi_IP>:1880/ui`
3. Test by observing sensor data updates and interacting with control buttons.
